Table 1: Event list and time of peak emission. The location is the [X,Y] distance (arcsec) from disk center to the peak HXR footpoint centroid in the 50-100 keV image. The coronal density is estimated from emission measures determined from RHESSI spectral fits and images (AH17). A list of available complementary data during the impulsive phase of the flare is given in Column 6. The loop half-length is estimated from RHESSI images (AH17).
